

Record no known allergies

Last Modified on 17/11/2021 2:38 pm AEDT

Record that a patient has no allergies. This can be done during the initial consult and needs to be recorded before you can create a prescription.

All recorded allergies are displayed on the top left of the prescription's screen when **writing a script**. Recorded allergies will not prevent you from creating a script. You will be prompted to enter allergy information if none has been recorded.

To update a patient's allergy record:

1. Go to Zedmed's **Reception** tab.

Select **Clinical Records** then locate the patient and open their record.

Alternatively, you could **admit the patient from the waiting room**.

2. In the **Reference View** section, select the **Allergies Maintenance** icon.

This will start the encounter and open the **Allergies and Adverse Reactions** screen.

Alternatively, you can start an encounter and select **Allergies** from the **Current Encounter** menu.

3. Check there are no allergies in the **Existing Patient Allergies** box.

If there are, they will need to be removed by right-clicking and selecting delete.

4. Select the **No Known Allergies** box.

Alternatively, you can also select the **No Known Allergies** button on the bottom left. It's the same as the tick box.

5. Select **Close** to save and exit.
